Summary

Backend-focused developer specializing in **FastAPI, PostgreSQL, and REST APIs**, with experience building secure and scalable backend systems. Skilled in **authentication, caching, asynchronous processing, database optimization, and API performance** using Redis, Celery, and Docker.

Skills

- **Languages:** Python, Java, JavaScript, SQL
- **Core CS:** Object-Oriented Programming (OOP), Data Structures & Algorithms (DSA)
- **Backend:** FastAPI, REST APIs, JWT Authentication, SQLAlchemy, Redis, Celery
- **Frontend:** React, JavaScript, HTML, CSS
- **Database:** PostgreSQL
- **Machine Learning:** Scikit-learn, Feature Engineering, Model Deployment
- **Tools:** Git, Docker, Postman, Redis CLI

Projects & Experience

Insurance Prediction System (Full Stack + ML)

GitHub | Live | API

- Built and deployed a full-stack ML application using FastAPI, achieving 40–50ms average API response latency
- Reduced model MAE from 4213 to 3941 (~6.5%) through log transformation and outlier analysis
- Containerized the application using Docker for consistent development and deployment
- Implemented rate limiting and middleware-based request processing to improve API reliability and performance
- Strengthened application security using HTTP-only cookies, CSP headers, and role-based access control (RBAC)
- Optimized PostgreSQL schema and queries for efficient data access and prediction storage
- Built an admin dashboard to monitor user activity, predictions, and usage analytics

SmartLink Analytics Platform (Full Stack Project)

GitHub

- Developed a scalable full-stack SmartLink Analytics Platform using FastAPI, React, PostgreSQL, Redis, Celery, and REST APIs
- Implemented JWT-based authentication with secure user signup, login, and protected API access
- Implement URL shortening and redirection system with custom alias generation, validation, and Redis-based caching for faster redirects
- Designed an analytics dashboard displaying total clicks, unique visitors, device usage, geographic insights, and date-wise traffic analytics
- Integrated Redis + Celery background workers to asynchronously process click analytics and improve backend performance under concurrent traffic
- Implemented visitor tracking features including device/OS detection, user-agent parsing, and IP-based analytics collection
- Integrated an LLM-powered analytics summaries to generate automated traffic insights, user behavior trends, and engagement reports from collected analytics data

Education

Jamia Millia Islamia
