Summary

Backend-focused developer specializing in FastAPI and PostgreSQL, building scalable, high-performance APIs (40–50ms latency). Experienced in authentication (JWT, RBAC), system design, and performance optimization.

Skills

- **Backend:** FastAPI, REST APIs, API Development, JWT Authentication, Celery, Redis
- **Frontend:** React, JavaScript, HTML, CSS
- **Database:** PostgreSQL, SQL, SQLAlchemy
- **Machine Learning:** Scikit-learn, Model Deployment, Feature Engineering
- **Languages:** Python, Java, JavaScript
- **Tools:** Git, Docker, Postman, Redis CLI

Projects & Experience

Insurance Prediction System (Full Stack + ML)

GitHub | Live | API

- Engineered and deployed a full-stack ML system with real-time inference (40–50ms latency) using FastAPI
- Enhanced model accuracy via log transformation, reducing MAE from 4213 to 3941 (~6.5%) while analyzing outlier impact
- Containerized application using Docker, reducing cold-start latency to 10–15s
- Architected scalable backend with middleware logging, rate limiting, and efficient request handling
- Strengthened application security using HTTP-only cookies, CSP headers, and role-based access control (RBAC)
- Refined PostgreSQL queries and schema for improved performance on large datasets
- Built admin dashboard to monitor user activity, predictions, and usage analytics

SmartLink Analytics Platform (Full Stack Project)

GitHub

- Developed a scalable full-stack SmartLink Analytics Platform using FastAPI, React, PostgreSQL, Redis, Celery, and REST APIs
- Implemented JWT-based authentication with secure user signup, login, and protected API access
- Built URL shortening and redirection system with custom alias generation, validation, and Redis-based caching for faster redirects
- Designed an analytics dashboard displaying total clicks, unique visitors, device usage, geographic insights, and date-wise traffic analytics
- Integrated Redis + Celery background workers to asynchronously process click analytics and improve backend performance under concurrent traffic
- Implemented visitor tracking features including device/OS detection, user-agent parsing, and IP-based analytics collection
- Added AI-powered analytics summaries to generate automated traffic insights, user behavior trends, and engagement reports from collected analytics data

Education
